Directional seated valves

Directly actuated, leakagefree for hydraulic systems For the assembly on connection sub-plates

Valve for sub-plate mounting Valve with individual connection sub-plate Directional valve bank Section 3 Section 5 D 7302 Pressure $p_{max} = 350...500 (700) \text{ bar}$ Flow $Q_{max} = 6...65 \text{ lpm}$

1. General information

Directional control valves are generally used for the direct, leakage free control of consumers and as pilot valves for hydraulically actuated valves (depending on the flow pattern). They are designed as spring returned ball seated valves. The valve elements are forced into their respective switching position against the spring force and fluid pressure by various actuation elements via an elbow lever acting on a pin. A strainer insert in the inlet port prevents the entry of coarse contamination.

The fluid ducts end as holes with O-ring seals at the ground, bottom surface of the valve body. Pipes may be connected either via customer furnished connection blocks or sub-plates (for individual valves with sub-plates see sect. 5 or for valve banks see D 7302). These valves do not show any leakage in blocked switching position. Reliable shifting is ensured, as these valves are designed as ball seated valves where there is no seizing or sticking in working position under full pressure. The leverage between actuation and valve element ensures low actuation forces and smooth shifting. To avoid interaction, most of these directional control valves are available with check valve inserts and return pressure stops or orifice inserts to limit the inflow of oil.

Individual valves with sub-plate, enabling direct pipe connection, may be equipped with a by-pass check valve, a pressure limiting valve, or a rectifier circuit by means of check valves.

2. Overview

(For complete type overview, see sect. 8) Individual valve for manifold mounting

e.g. GS 2-1-G 24

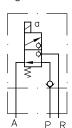

Solenoid actuated 2/2-way directional seated valve, size 1, free flow when deenergized Individual valve with connection sub-plate for direct pipe connection

e.g. GZ 3-2R-3/8-G 24

Solenoid actuated 3/2-way directional seated valve, size 2 with check valve insert in port P

Tapped ports in the connection sub-plate, G 3/8 (BSPP)

Actuation modes

For detailed data. see section 4++.

R	F P	all	Insert check valves acc. to D 7325 e.g. type ER 01 for size 0	,,	Not avail. for 3/3- and 4/3-way directional spool valves type21 and22 The check valve prevents an uncontrolled impact or reflow R→P or A→F e.g. if the inlet pressure at P drops below the consumer pressure at (during idle position or actuation of another consumer with a lower pressure requirement) when several valves are connected in parallel. A pressur reduction is prevented during such switching operations.					
В	F P	all	size 0 = EB 0-0,6 1 = EB 1-0,8 2 = EB 2-1,2 3 = EB 3-2,5 4 = EB 4-4,0	Insert orifices type EB acc. to D 6465	Not available for 4/3-way valves type22! The orifice serves to limit the flow (see ∆p-Q curves) and should be installed if flow rates higher than Q _{max} (table 2) can occur while switching from P→A(R): Hydraulic accumulators on the pump side P or in the case of hydr. servo operation of directional spool valves with control oil supply from the high flow main gallery.					
s		0	7332 000 a 7332 000 b	Return pressure stop	Only available for 3/2-way valves types3 orZ3 Check valves may be installed in the reflow ports R of 3/2-way valves size 0 and 1. With parallel shifting of several valves, they prevent pressure surg-					
	A combination with check valve or orifice in port P is possible e.g. G 3-1 BS-G 24, GZ 3-1 RS-G 24				es from migrating via the common reflow gallery into non-operated, easily moving and unloaded consumers if there is a connection A—R, thus preventing uncontrolled extension movements. Such pressure surges car be caused by shifting operations. These check valves are not intended to blocking off hydraulic oil, which depending on the combination of switching operations of other valves, can arise at port R.					

3.2 Further characteristic data

3.2.1 General and hydraulic parameters

Description 2/2-, 3/2-, 3/3, 4/3- and 4/2-way valve

Design Seated ball valve

Installation position Any; Vertically with actuation up (best)

Direction of flow Only in arrow direction acc. to flow pattern in sect. 3.1

The location of ports P (pump), R (return flow), A and B (consumers) are dictated by the internal

design and can't be readily interchanged.

Overlap Negative, i.e. the transition from shifting pos. 0 into a and vice versa is gradual, with 3/2-way valves

all ports may be interconnected during this state. See also sect. 3.1 (table 3) "Additional orifice"!

Operation pressure See sect. 3.1. All ports may be subject to the full oper. pressure, but a pressure drop must be

maintained in flow direction acc. to the flow pattern in sect. 3.1, i.e. $P \ge A(B) \ge R$. With 4/3-way valves connection R must be employed as return flow only.

For permissible pressure during switching operations, see sect. 4.1.

Static overload capacity Approx. 2 x p_{max}, applies only to valves in idle position (p_{max} from table 2 sect. 3.1)

Flow rating See sect. 3.1. Pay attention to the area ratio of double acting consumers (differtial cylinders), i.e. the

return might be higher than the inflow.

Pressure fluid Hydraulic oil conforming DIN 51524 part 1 to 3: ISO VG 10 to 68 conforming DIN 51519

Viscosity limits: min. approx. 4, max. approx. 800 mm²/s

Optimal operation: Approx. 10 ... 200 mm²/s

Also suitable for biological degradable pressure fluids types HEPG (Polyalkylenglycol) and HEES

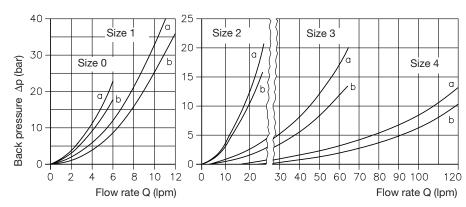

(Synth. Ester) at service temperatures up to approx. +70 °C. For other fluids see sect. 6.2.

Temperature Ambient: approx. -40...+80°C; Fluid: -25...+80°C, pay attention to the viscosity range!

Start temperature down to -40°C are allowable (Pay attention to the viscosity range during start!), as long as the operation temperature during subsequent running is at least 20K higher. Biological degradable pressure fluids: Pay attention to manufacturer's information. With regard to the compat-

ibility with sealing materials do not exceed +70°C. Restrictions for version with ex-proof solenoid!

4.1.2 Solenoid voltage

Examples: GR 2-2 - G 24 (I_{20} = 0.54 A) G 3-0R - A 110 (I_{20} = 0.15 A) WGZ 4-1 - W 200 (I_{20} = 0.11 A)

The indicated nominal power ratings are approximate reference values, which may differ insignificantly depending on the voltage and the manufacturer of the solenoid. The current rating in cold state is $I_{20} = P_N / U_N$ (see examples)

1) Notes for proper selection:

DC:The order specification (solenoid) should be identical with the one of the power supply (DC). If the supply voltage is lower it will reduce the force of the solenoid, if it is higher the solenoid will be heated up unpermissibly (tolerance ± 5-10%).

AC: The order specification should be identical with the one of the power supply (50/60 Hz AC). The voltage of the solenoid is approx. $0.9~U_{AC}-2~V$ due to the corresponding bridge rectifier. The table identifies the solenoids utilized in such cases (e.g. for 110V AC 50 Hz; solenoid with $U_N=98V~DC$)

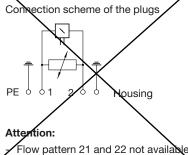

Attention: It is important to specify the voltage!

4.2 Hydraulic and pneumatic actuation

The actuation element is a single acting piston with spring return.

The valve will remain in its working position a as long as the control pressure prevails. It will return automatically in its idle position 0 if the control pressure is relieved.

The piston is sealed and operates without any leakage.

Actuation	Hydraulically (Size 0 3)				Pneumatically (Size 1, 2, 3)

4/3-way

5. Individual valve with connection sub-plate

All ports of the 2/2-, 3/2-, 3/3- and 4/3-way directional seated valves acc. to section 3 are designed as holes with O-ring sealing at the ground bottom of the valve body. These valves have to be completed with sub-plates or customer furnished manifolds to enable pipe connection.

5.1 Available versions, main data

Order example: GR 2-2 - 1/2S - G 12 - 220 Valve coding Desired pressure setting in bar acc. to sect. 3 (Pressure range depending on spring, see ②) Coding Ports con-Avail-Flow pattern overview forming able for ISO 228/1 size These symbols have to be completed with the actuation symbols. 2/2-way 3/2-way 3/3-way

-1/2 S(R)	G 1/2	2

Not available for other sizes!

1 and 2

-3/8 S(R)

-1/2 S(R)

The connection block with pressure limiting valve is not available for 3/3- and 4/3-way directional valves!

4/2-way

The pressure specification in the order coding determines the pressure range of the spring (size 0) and additionally the valve seat dimension for size 1 and 2.

Port R may be used only for unpressurized return flow to ensure proper function of the pressure reducing valve. Parallel connection of additional valves is only permissible with sub-plates acc. to ① but not with sub-plates acc. to ②

6. Appendix

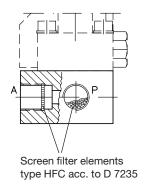

6.1 Protection of directional seated valves against coarse contamination

Directional seated valves are rather unsensitive to ultra fine contamination always evident in hydraulic fluids. Nevertheless directional seated valves are fitted with screen filter elements with 0.25 mm mesh width to prevent sudden disturbance caused by coarse contaminations that may occasionally be carried along in the oil (such as torn off particles of tubing, packing, scale swarf,) and which otherwise might get trapped at the valve seat gap.

The sub-plates for individual valves (sect. 5) are fitted with fine screen filter discs HFC 1/4F 1 or HFC 3/8 (acc. to D 7235) as standard at A and B with size 0, additionally in P with size 1. Valves size 2, 3 and 4 with port size G 3/8 * , G 1/2 * and G 3/4 * may be retrofitted-. These screen filters are not available for G 1 * . (* BSPP)

These screen filter elements must not be understood as a replacement for usual hydraulic filters. In practice, however, they provide sufficient protection against malfunctions in small hydraulic systems. If such malfunctions should occur, the filter elements should be checked first.

For the sake of simplicity, these filter elements are not explicitly shown in the diagrams.

6.2 Versions for special fluids

HFA (water / glycol solution, conforming VDMA 24317)

The functionally essential parts are of stainless steel or tuffrided to prevent corrosion (valve balls, valve seat, actuation pin etc.). The valve body (size 3), external parts e.g. tapped plugs etc. are zinc galvanized.

There are only 2/2-, 3/2- and 4/2-way directional seated valves available with flow pattern R2, S2, 3, a. Z3, 4, Z4 (see table 1 in sect. 3.1)

Note:

Type coding:

G 3-1-G 24 **HFA**

Size	Pres- sure p _{max} (bar)	Flow Q _{per} approx. w back pres 1 bar	ith reflow
0		3	4
1		5	6
2	400	14	18
3		36	45

A slight compensating force in the return pipe may be created by installing the tank at the highest possible location within the system.

Throttles (cascade type or a coiled, small diameter pipe) should be installed at the pressure inlet to limit the flow down to permissible values for the applied pressure. This is to prevent cavitation and applies to all valves with return connection (3/2- und 4/2-way valves and 2/2-way valve as by-pass to the tank) or valves in circuits connected to an accumulator.

Brake fluid based on glycol
 Versions equipped with EPDM (Ethylenpropylendien-rubber) seals suited for glycol based brake fluid or other special fluids.
 Type coding: GR 2-2-G 24 AT

Versions equipped with FKM (flour rubber, Viton) seals suited for some HFD type fluids (fire inhibiting, conforming VDMA 24317)
 Type coding: WGS 2-0-WG 230 PYD
